

# WHIT's Forensics Workstation Setup

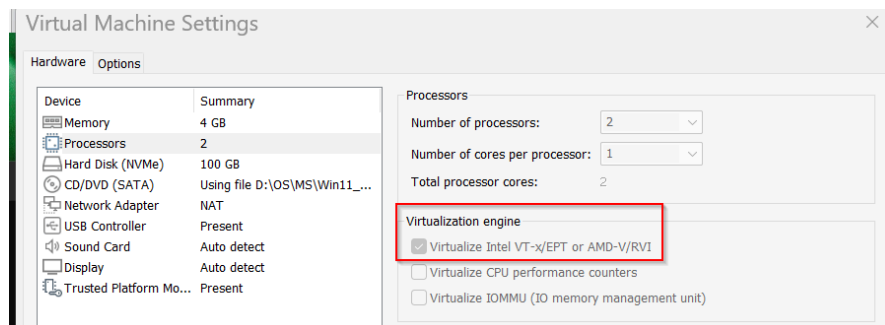

**FILES must be copied from “WHIT-s-Forensic-Workstation-main” to C:\setup**

This setup is accomplished with powershell scripts that allow customization. The scripts are written for PS 7+. It installs some of the tools using winget, others are downloaded from Github or other links. Tools are listed in “WHIT-Forensic-Tools.csv” Some steps are taken to remove applications that are not needed.

**There are several steps to getting a forensic system up and running:  
I find at least 16GB of Ram and 100GB of Disk is a good starting point.**

## Bios setup In VMWARE

## OS installation

Install Windows 11

Install PS v7 - PS>winget install --id Microsoft.PowerShell --source winget

Copy Files to C:\Setup

Update Windows run “WHIT-update.ps1”

# Setup

Review the following files, understand what they do, modify them to fit your needs.

- Whit-setup.ps1 - Main Script
- WHIT-Winget-Install.ps1 - Installs Winget applications
- whit-DL-FT-from-gh.ps1 - Downloads zip files from GITHUB
- whit-DL-FT-urls.ps1 - Downloads applications from URL's, Check sites for current versions
- WHIT-remove-apps.ps1 - Removes applications not needed
- WHIT-win11-reg-changes.reg - Sets different registry settings
- WHIT-C-Menu.reg - Creates explorer right click context menu
- AppsToRemove.txt - List of applications to remove

Then run the script whit-setup.ps1

This will create the C:\IR folder structure

```
C:\ir\1-Tools>  
CLIENT-TOOLS  
EVENTLOGS  
EZ  
FORENSICS  
IMAGE  
MAIL  
MALWARE  
MEMORY  
NETWORK  
UTIL
```

## **WHIT-Winget-Install.ps1**

This script installs applications that can be installed via Winget.

Review the script for the list of Applications

## **whit-DL-FT-from-gh.ps1**

This script downloads applications from GITHUB zip. The idea here is these should not need changing when updates are made to the GITHUB.

### **whit-DL-FT-urls.ps1**

Downloads from specific URL's these will need to be checked for updates.

### **WHIT-win11-reg-changes.reg**

This file modifies the registry with the following settings:

- Show hidden folders
- Start File Explorer on "This PC"
- Move Start Menu to the Left
- Disable Advertising for current user
- Disable Tailored experiences with diagnostic data for Current User
- Disable Online Speech Recognition
- Disable - Improve Inking & Typing Recognition
- Disables "Tailored Experiences" (personalized tips, ads, and recommendations)
- Disable Let Windows improve Start and search results by tracking app launches
- Disable Activity History
- Set Feedback Frequency to Never
- Disable personalization of ads, Microsoft Edge, search, news and other Microsoft services by sending browsing history, favorites and collections, usage and other browsing data to Microsoft
- Disable required and optional diagnostic data about browser usage
- Hide Search box or Search icon
- Disable new context menu
- Disable the Fast Startup feature in Windows (10/11), forcing a full shutdown instead of a hybrid hibernation state

### **WHIT-C-Menu.reg**

The file "WHIT-C-Menu.reg" sets up a right click context menu

HxD

ExIfTool

PESTudio

TimelineExplorer

RegistryExplorer.exe

Nirsoft EventViewer

### **WHIT-remove-apps.ps1**

This script loops through "**AppsToRemove.txt**" trying to remove the applications in the list.  
This script IMO takes too long.

### **Add ps shortcut**

PS 7 should run with Admin rights

c:\setup\whit-ps-sc.ps1

**To update winget packages**

PS> winget update -all
